

***Glaucidium brasilianum medianum* subsp. nov.**

Brown phase: differs from *Glaucidium brasilianum ridgwayi* Sharpe in the much browner, less grayish tone of the upper parts, and in the decidedly more rufescent, less grayish, color of the streaks of the under parts. From *Glaucidium brasilianum phalaenoides* (Daudin) it differs in its paler, more buffy brown color above, less heavily streaked under parts, and more decidedly and more regularly barred tail.

*Type*, No. 8940, Collection Carnegie Museum, adult male; Bonda, Santa Marta, Colombia, October 6, 1899, G. H. Hull.

***Falco fusco-cærulescens septentrionalis* subsp. nov.**

Similar in color to *Falco fusco-cærulescens fusco-cærulescens* Vieillot, but decidedly larger. Wing (female), 294; tail, 201; exposed culmen, 20; tarsus, 49; (male; type) wing, 267; tail, 180; exposed culmen, 22.5; tarsus, 47.

*Type*, No. 111,485, Collection U. S. National Museum; adult male; Fort Huachuca, Arizona, May 6, 1887; Lt. Harry C. Benson.
