

## GREENS DESCRIBE THREATS FROM OFFSHORE FRACKING IN CALIFORNIA

Alex Guillén

September 12, 2014

Fracking off the coast of California poses threats via air pollution, wastewater discharge and seismic activity, the Center for Biological Diversity says in a new report.

"Offshore fracking and similar methods of oil extraction are inherently dangerous, posing unacceptable risks to our fragile marine ecosystem, the health of coastal communities, our climate, and California's infrastructure

through increased earthquake risk," the report says. "In light of the mounting evidence of offshore fracking's threats, California must move quickly to end oil companies' use of this toxic technique."

CBD and other groups have been pushing for the California Coastal Commission, which has been meeting this week, to halt fracking in the state's coastal water, and polls have found a majority of the public supports such action
